HubSpot FP&A case study

Q2:26 variance review and H2 operating forecast | USD millions, except customers and percentages

Executive view. Q2 reported revenue exceeded the midpoint of HubSpot's May guidance by $14.2 million (1.6%). Against an illustrative analyst GAAP cost plan, operating income was $14.5 million higher. The H2 base case produces $1,908.6 million of revenue. Slower customer additions and subscription yield growth reduce the downside case to $1,844.1 million.

Q2 result versus planning benchmark

	Illustrative plan	Reported actual	Actual - plan
Total revenue	**$897.5**	**$911.7**	**$14.2**
GAAP operating income	28.8	43.3	14.5
GAAP operating margin	3.2%	4.8%	1.5 pp

Revenue plan equals the midpoint of published Q2 guidance. The cost plan and its GAAP operating income are illustrative analyst assumptions using Q1 GAAP cost ratios. HubSpot did not report an internal budget.

Revenue variance bridge

Bridge from $897.5 million plan	Impact
Illustrative plan revenue	$897.5
Average customer count	(0.0)
Effective quarterly subscription yield	15.2
Services and other revenue	(1.0)
Reported revenue	**$911.7**
Net revenue variance	**$14.2**

Reported net customer additions were 6,988, almost equal to the illustrative 7,000 plan. The model's effective quarterly subscription yield was about $2,951 per average customer versus $2,901 implied by the plan. Subscription cost of revenue was $14.8 million above the Q1-rate cost plan, partly offset by R&D expense $12.8 million below it. These comparisons use analyst assumptions and are not claims about HubSpot's internal spending targets.

H2 scenario comparison

Illustrative case	H2 revenue	H2 GAAP operating income	Q4 ending customers
Base	$1,908.6	$93.4	323,946
Downside	1,844.1	34.1	314,946

FP&A follow-up. Track net customer additions and subscription yield separately. Review whether subscription cost remains near the base-case 16.3%-16.5% of subscription revenue. Refresh Q3 actuals and reforecast Q4 when the next filing is available.

Scope and sources

This is an independent educational operating model based on public GAAP results and hypothetical scenario inputs. The effective-yield proxy equals subscription revenue divided by average beginning and ending customers. It is not HubSpot's reported average subscription revenue per customer. The model excludes monthly actuals, churn, ARR, cash flow, and any undisclosed internal budget.
